# **Method of Joints**

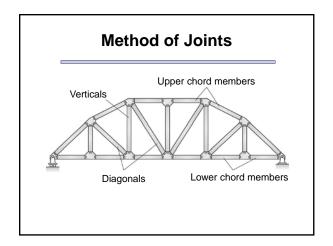

- If a truss is in equilibrium, then each of its joints must be in equilibrium.
- The method of joints consists of satisfying the equilibrium equations for forces acting on each joint.

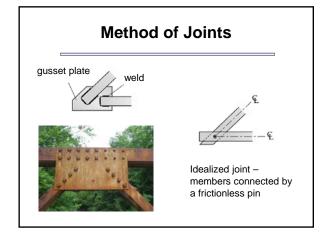

$$\sum F_x = 0$$
  $\sum F_y = 0$ 

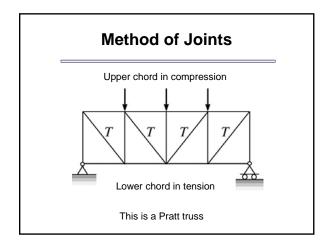

# **Method of Joints**

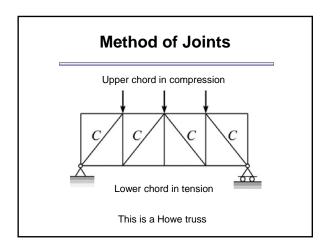

- Recall, that the line of action of a force acting on a joint is determined by the geometry of the truss member.
- The line of action is formed by connecting the two ends of each member with a straight line.
- Since direction of the force is known, the remaining unknown is the magnitude of the force.

#### **Method of Joints**

**Procedure for analysis** - the following is a procedure for analyzing a truss using the method of joints:

- 1. If possible, determine the support reactions
- Draw the free body diagram for each joint. In general, assume all the force member reactions are tension (this is not a rule, however, it is helpful in keeping track of tension and compression members).

#### **Method of Joints**

**Procedure for analysis** - the following is a procedure for analyzing a truss using the method of joints:

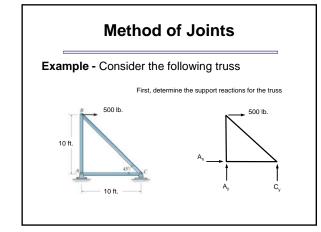

3. Write the equations of equilibrium for each joint,

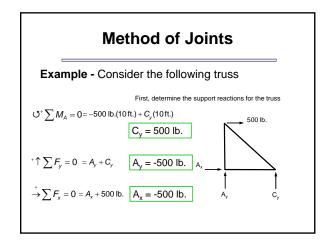

$$\sum F_x = 0$$
  $\sum F_y = 0$ 

#### **Method of Joints**

**Procedure for analysis** - the following is a procedure for analyzing a truss using the method of joints:

- If possible, begin solving the equilibrium equations at a joint where only two unknown reactions exist.
   Work your way from joint to joint, selecting the new joint using the criterion of two unknown reactions.
- Solve the joint equations of equilibrium simultaneously, typically using a computer or an advanced calculator.

#### **Method of Joints**

The equations of equilibrium for Joint A

$$F_{AB}$$
 $F_{AC}$ 
 $F$ 

# **Method of Joints**

The equations of equilibrium for Joint B

$$\xrightarrow{500 \text{ lb.}} \xrightarrow{+} \sum F_x = 0 = F_{BC} \cos 45^{\circ} + 500 \text{ lb.}$$

$$F_{BC} = -707.2 \text{ lb.}$$

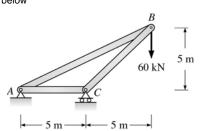

The forces in the truss can be summarized as:

$$F_{AB} = 500 \text{ lb. (T)}$$
  $F_{BC} = 707.2 \text{ lb. (C)}$ 

 $F_{AC} = 500 \text{ lb. (T)}$

**Problem** – Determine the force in each member of the truss shown below

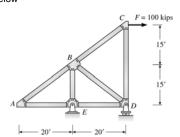

# **Method of Joints**

**Problem** – Determine the force in each member of the truss shown below

#### **Zero Force Members**

- Truss analysis may be simplified by determining members with no loading or zero-force.
- These members may provide stability or be useful if the loading changes.
- Zero-force members may be determined by inspection of the joints

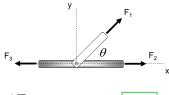

#### **Zero Force Members**

Case 1: If two members are connected at a joint and there is no external force applied to the joint

#### **Zero Force Members**

Case 2: If three members are connected at a joint and there is no external force applied to the joint and two of the members are colinear

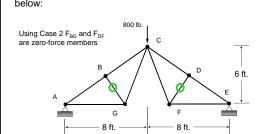

$$^{+}\uparrow\sum F_{v}=0=F_{1}\sin\theta$$

 $F_1 = 0$ 

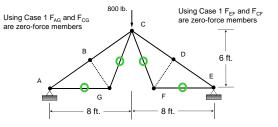

# Zero Force Members

Determine the force in each member of the truss shown below:
